

iKeyp® BOLT

WI-FI CONNECTED

By connecting the iKeyp Bolt to the internet via Wi-Fi, it can automatically update itself with new features and communicates with the owner in real-time to provide critical notifications via text, email or the iKeyp mobile app.

REMOTE OPEN

Remote open the safe door from anywhere or have iKeyp Customer Support open it up in the event you misplace your backup keys and forgot your access code.

SMARTPHONE ALERTS

As an "Internet of Things" device, the iKeyp Bolt takes advantage of smartphone connectivity by providing a rich mobile app experience for users. The ability to customize reminders and receive security alerts in real-time ushers in a new level of personalized safety and convenience.

DIGITAL COMBINATION

The iKeyp Bolt provides for a custom, user-programmable 4 to 8-digit access code via the easy-to-use waterproof digital touch-sensitive keypad.

SECURE INSTALLATION

Included bolt down hardware ensures thieves cannot easily remove the iKeyp Bolt safe from its installed location.

MSRP: \$149.00

Advanced Technology Features

AUTOMATIC SOFTWARE UPDATES

The iKey Bolt has been engineered with sophisticated communication intelligence that will automatically update the software on the safe to provide new features and enhancements as they are developed in the future. This built-in functionality will allow the safe to adapt to various user needs that have yet to be uncovered. Now that is SMART!

IKIEP MOBILE APPLICATION

The mobile application provides a multitude of notifications to users such as security alerts and medication reminders. These notifications can be extended to roommates, loved ones or caregivers as additional oversight to security and medication adherence.

From the mobile application, users can manage their safe, reminder and account settings in addition to having quick access to notification history and a convenient user dashboard.

Leveraging the iKey Smart Safe inherent Internet of Things (IoT) capabilities, users can also grant physical access to third parties by either remotely opening the safe door or changing the access code on demand... all from anywhere around the world in real-time.
